

# WP3

March 24, 2004

Cees de Laat,  
UvA,  
The Netherlands

# Talk Outline

v Wait 15 minutes

## WP3 objectives

- ✓ **Task 3.1. Performance validation**
  - ✓ Create, collect, test network-tools to cope with the extreme Lambda environment (high RTT, BW)
  - ✓ measure basic properties and establish a baseline performance benchmark
- ✓ **Task 3.2 End user performance validation/monitoring/optimization**
  - ✓ Use "out of band" tools to measure and monitor what performance a user in principle should be able to reach
- ✓ **Task 3.3 Application performance validation, monitoring and optimization**
  - ✓ Use diagnostic libraries and tools to monitor and optimize real applications to compare their performance with task 3.2 outcome.

## WP3 achievements t3.1

- ✓ Performance Test Tools
  - ✓ [http://carol.science.uva.nl/~jblom/datatag/wp3\\_1/tools/test\\_tools.html](http://carol.science.uva.nl/~jblom/datatag/wp3_1/tools/test_tools.html)
- ✓ Lambda's are a Layer 1-2(-3) environment
  - ✓ use end to end traffic generating tools
  - ✓ not ICMP based tools since those need routers in the path
  - ✓ tools must work in Gigabit environment
- ✓ Netperf
  - ✓ TCP bulk transfer, UDP unusable (no shaping)
  - ✓ modifications made to enhance IPv6 support
- ✓ Iperf
  - ✓ TCP and UDP shaped bulk transfer
  - ✓ lightweight multiple streams test support
  - ✓ IPv6 support
  - ✓ modifications made to introduce TCP shaping, debugging

# Understand Lightpath

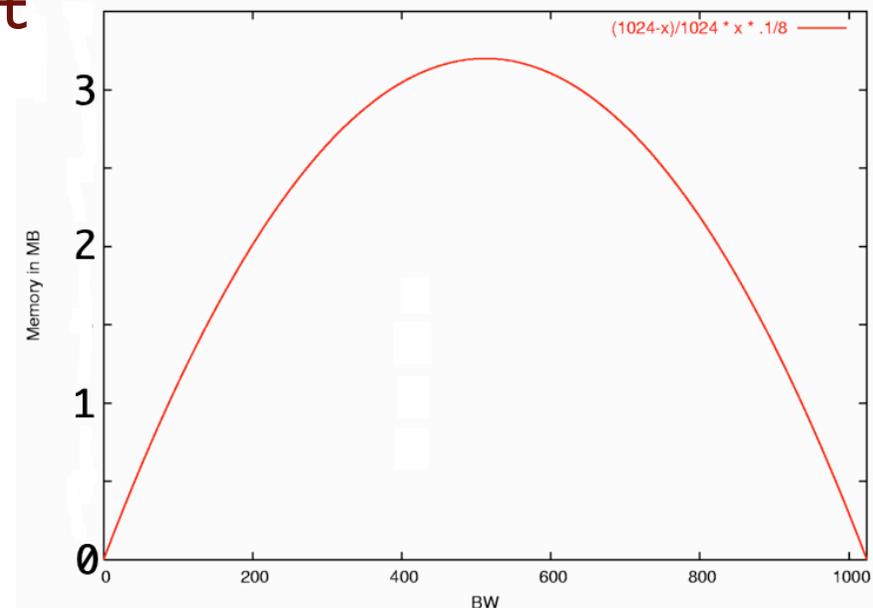

TCP is bursty due to sliding window protocol and slow start algorithm.

Window = BandWidth \* RTT & BW == slow

Memory-at-bottleneck =  $\frac{\text{fast} - \text{slow}}{\text{fast}} * \text{slow} * \text{RTT}$

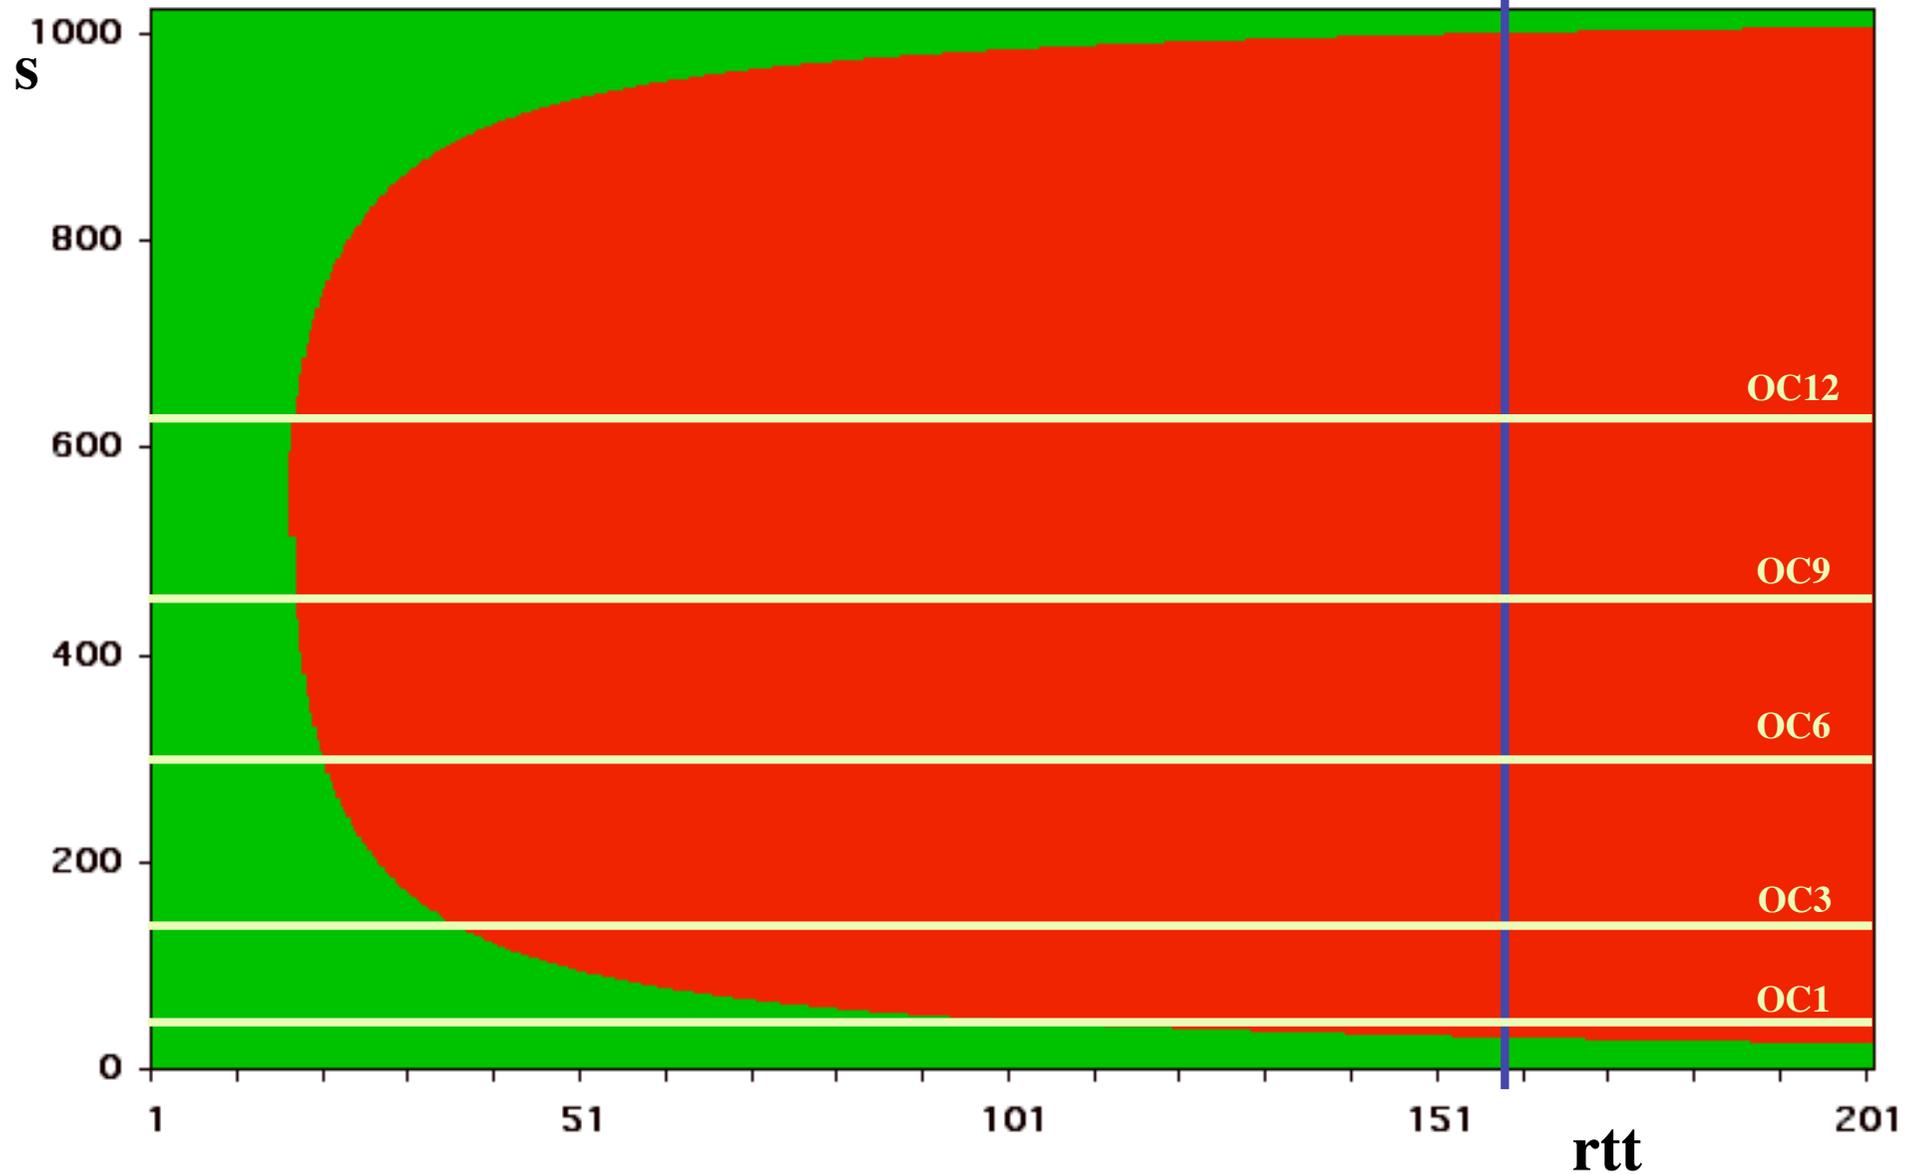

So pick from menu:

- ◆ Flow control
- ◆ Traffic Shaping
- ◆ RED (Random Early Discard)
- ◆ Self clocking in TCP
- ◆ Deep memory

**Forbidden area, solutions for  $s$  when  $f = 1$  Gb/s,  $M = 0.5$  Mbyte  
AND NOT USING FLOWCONTROL**

158 ms = RTT Amsterdam - Vancouver

# SCTP Performance

- ✓ Stream Control Transmission Protocol:
  - ✓ TCP-lite
- ✓ Few versions support Linux
- ✓ LK-SCTP not optimized for performance:
  - ✓ Not currently usable for Grids
- ✓ Feedback to SCTP protocol designers
- ✓ Results put on the Web:
  - ✓ one of the pages with the greatest hit rate

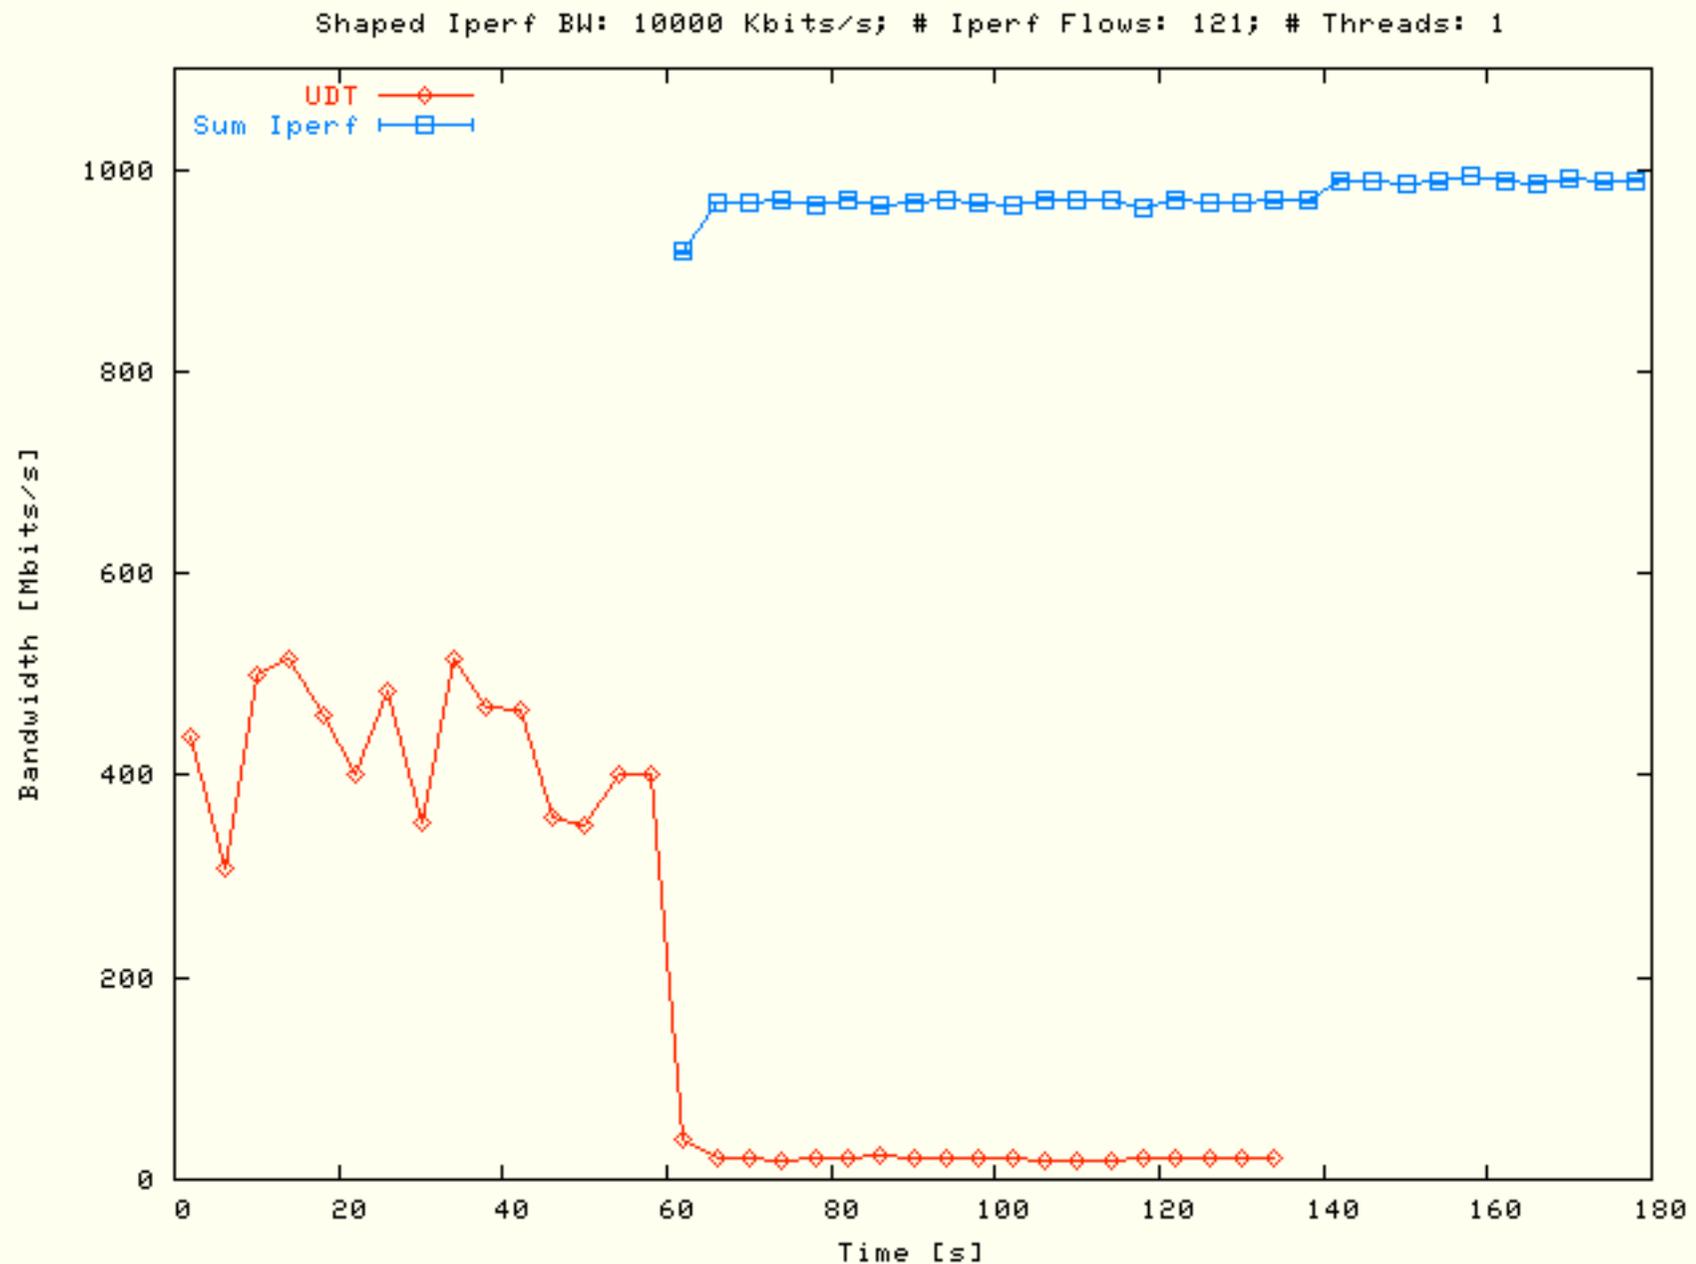

# Protocol Testbed

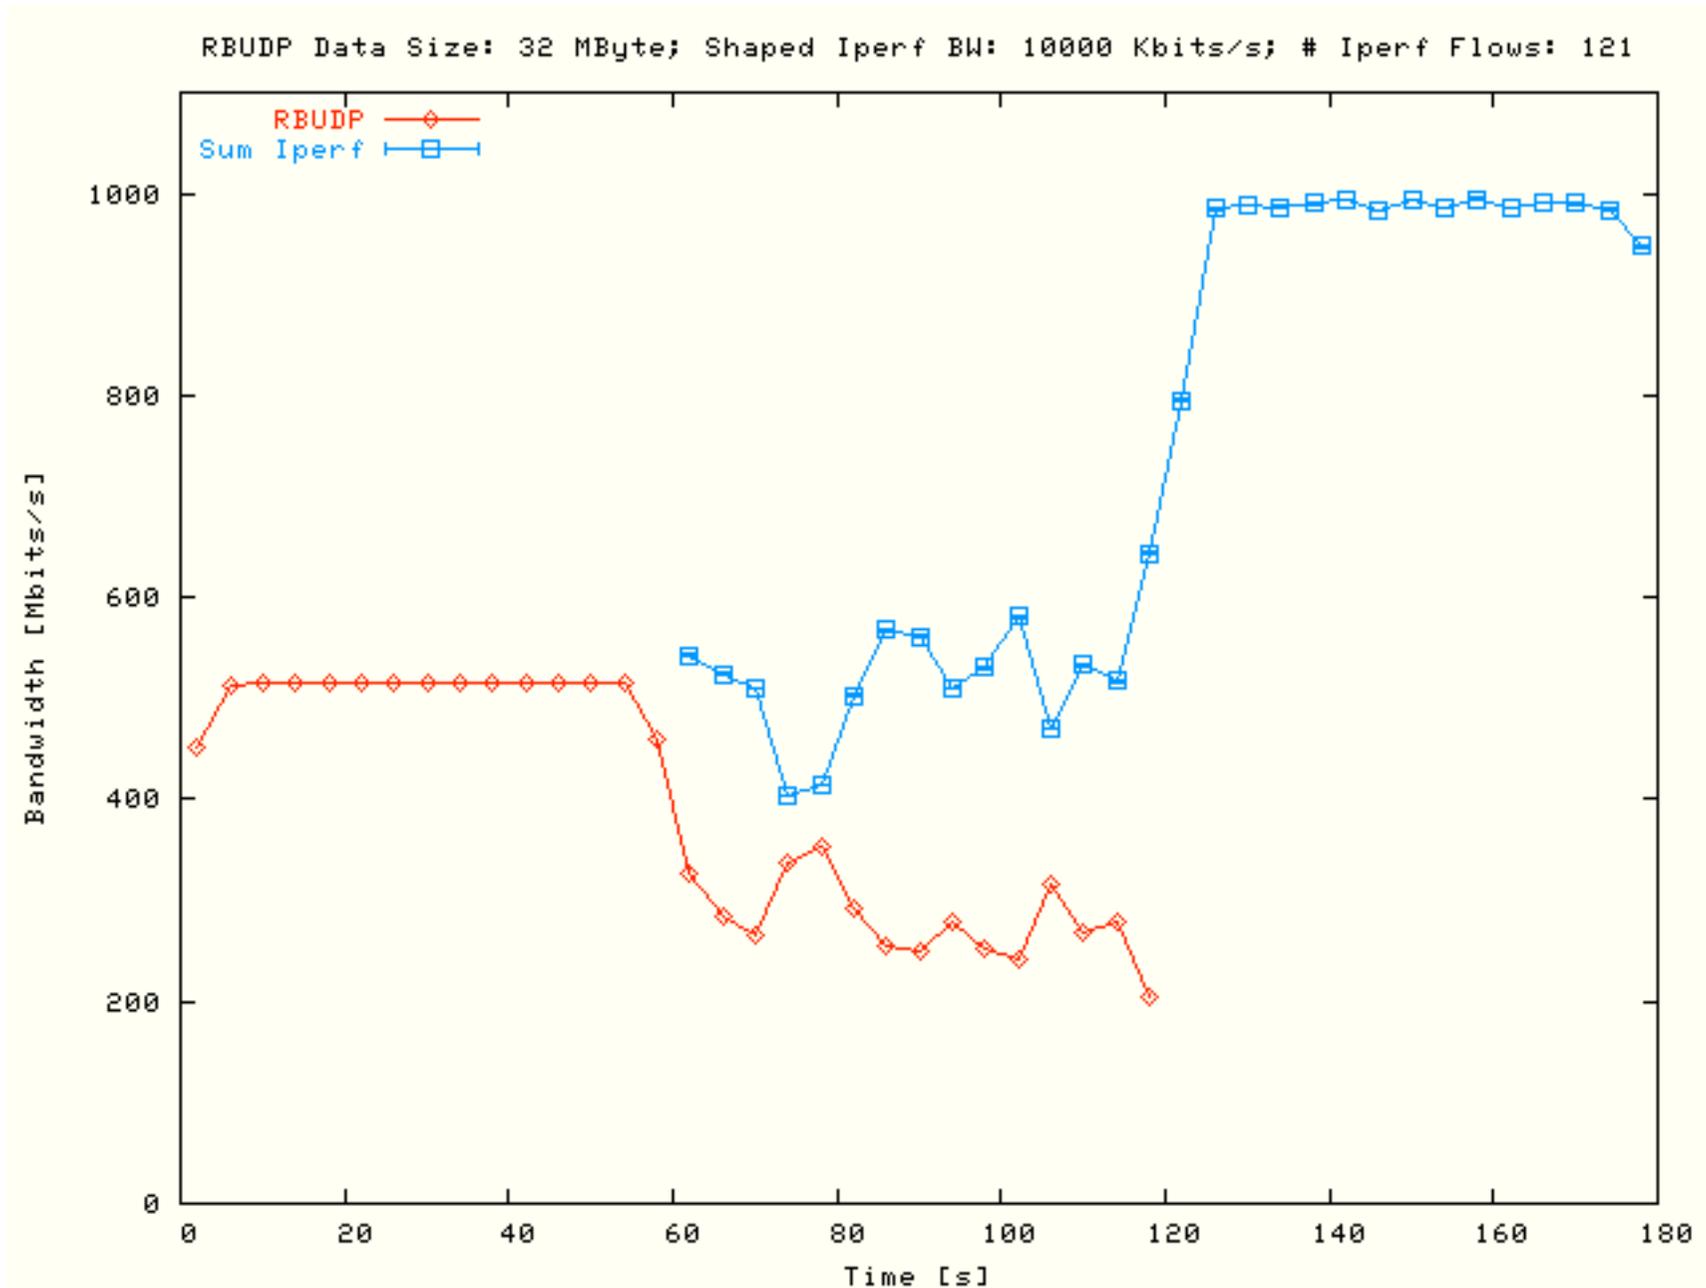

- ✓ Non Goal
  - ✓ To come up with yet another protocol
- ✓ Goal
  - ✓ To test new and supposedly aggressive protocols mixed with many vanilla streams in controlled environments
- ✓ How
  - ✓ Use gridcluster to generate #100<sup>ths</sup> of shaped flows background and monitor those small flows
  - ✓ Start special protocol stream
  - ✓ As function of RTT!

# Test of UDT

# Test of RBUDP

## End user performance validation / monitoring / optimization t3.2

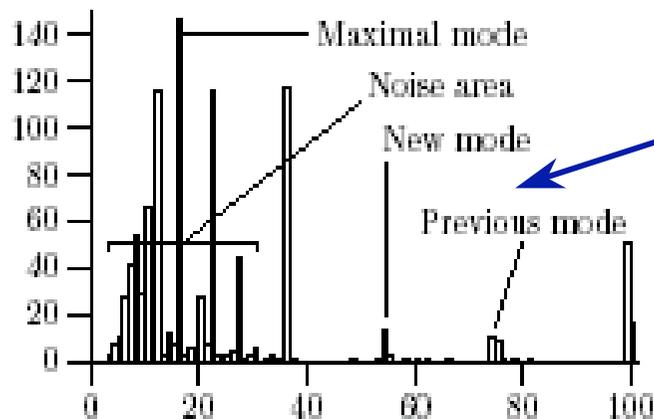

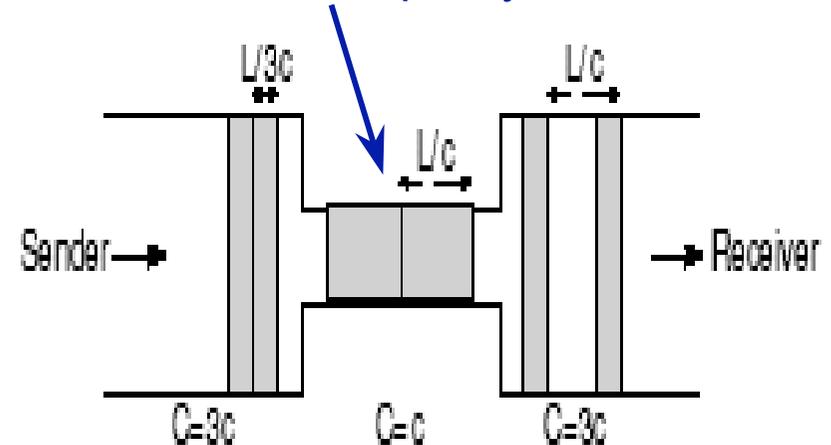

- ✓ Overview of tools (continuously updated)
  - ✓ [http://carol.science.uva.nl/~jblom/datatag/wp3\\_1/tools/monitor\\_tools.html](http://carol.science.uva.nl/~jblom/datatag/wp3_1/tools/monitor_tools.html)
- ✓ Homebrew:
  - ✓ rTPL(end user performance monitoring):
  - ✓ <http://carol.science.uva.nl/~jblom/rtpl/>
- ✓ Current monitors (Amsterdam):
  - ✓ <http://195.169.124.34/monitor/index.html>
- ✓ TraceRate
  - ✓ next slides in more detail

# Tools: Trace-Rate Hop by hop measurements

- v A method to measure the hop-by-hop capacity, delay, and loss up to the path bottleneck
  - Not intrusive
  - Operates in a high-performance environment
  - Does not need cooperation of the destination
- v Based on Packet Pair Method
  - Send sets of b2b packets with increasing time to live
  - For each set filter "noise" from rtt
  - Calculate spacing – hence bottleneck BW
- v Robust regarding the presence of invisible nodes

Effect of the bottleneck on a packet pair.  
 $L$  is a packet size  
 $C$  is the capacity

Examples of parameters that are iteratively analysed to extract the capacity mode

## Tools: Trace-Rate Some Results

- Capacity measurements as function of load in Mbit/s from tests on the DataTAG Link:

|          | tracerate |      |      | pathchar |     |     | pathrate |         |         |
|----------|-----------|------|------|----------|-----|-----|----------|---------|---------|
|          | 0%        | 25%  | 50%  | 0%       | 25% | 50% | 0%       | 25%     | 50%     |
| Hop #1   | 165       | 170  | 165  | 92       | 92  | 93  | N/A      | N/A     | N/A     |
| Hop #2   | *162      | *165 | *162 | 996      | 977 | 832 | N/A      | N/A     | N/A     |
| Hop #3   | 933       | 862  | 862  | N/A      | N/A | N/A | 981-986  | 760-776 | 927-947 |
| Duration | 2'40      | 2'40 | 2'40 | N/A      | N/A | N/A | 25''     | 5'30    | 5'40    |

- Comparison of the number of packets required

|              | pathchar | clink  | pchar  | nettimer | tracerate |
|--------------|----------|--------|--------|----------|-----------|
| 4 hops path  | 11,562   | 6,002  | 11,732 | 982      | 4,000     |
| 11 hops path | 31,782   | 16,400 | 32,417 | 6,663    | 11,000    |

- Validated by simulations in NS-2
- Linux implementations, working in a high-performance environment
- Research report: <http://www.inria.fr/rrrt/rr-4959.html>
- Research Paper: ICC2004 : International Conference on Communications, Paris, France, June 2004. IEEE Communication Society.

# Gigabit Network Monitoring

- ✓ Tested non-intrusive monitoring techniques:
  - ✓ Complement 2002 work on intrusive techniques
- ✓ Use performance data available in network devices and hosts:
  - ✓ SNMP MIBs
- ✓ Investigated usefulness of Web Services:
  - ✓ UDDI is not appropriate for service discovery

# Grid Application Monitoring

## t3.3

- ✓ Tested integration of NetLogger (LBNL) and GridFTP (Argonne):
  - ✓ Detailed information about the performance of Grid applications
- ✓ Integration is difficult
- ✓ Few versions interoperate smoothly
- ✓ Detailed how-to on the Web

# Q&A

2<sup>nd</sup> Annual Review of the DataTAG Project – 24 March 2004
