StarPlane Approach

- StarPlane is a NWO funded project with major contributions from SURFnet and NORTEL.
- The vision is to allow part of the photonic network infrastructure of SURFnet6 to be manipulated by Grid applications to optimize the performance of specific e-Science applications.
- StarPlane will use the physical infrastructure provided by SURFnet6 and the distributed supercomputer DAS-3.
- The novelty: to give flexibility directly to the applications by allowing them to choose the logical topology in real time, ultimately with subsecond lambda switching times.

GRID-Colocation problem space

StarPlane applications

- Large 'stand-alone' file transfers
 - User-driven file transfers
 - Nightly backups
 - Transfer of medical data files (MRI)
- Large file (speedier) Stage-in/Stage-out
 - MEG modeling
 - Analysis of video data
- Application with static bandwidth requirements
 - Distributed game-tree search
 - Remote data access for analysis of video data
 - Remote visualization
- Applications with dynamic bandwidth requirements
 - Remote data access for MEG modeling
 - SCARI

In The Netherlands SURFnet connects between 180:

- universities;
- academic hospitals;
- most polytechnics;
- research centers.

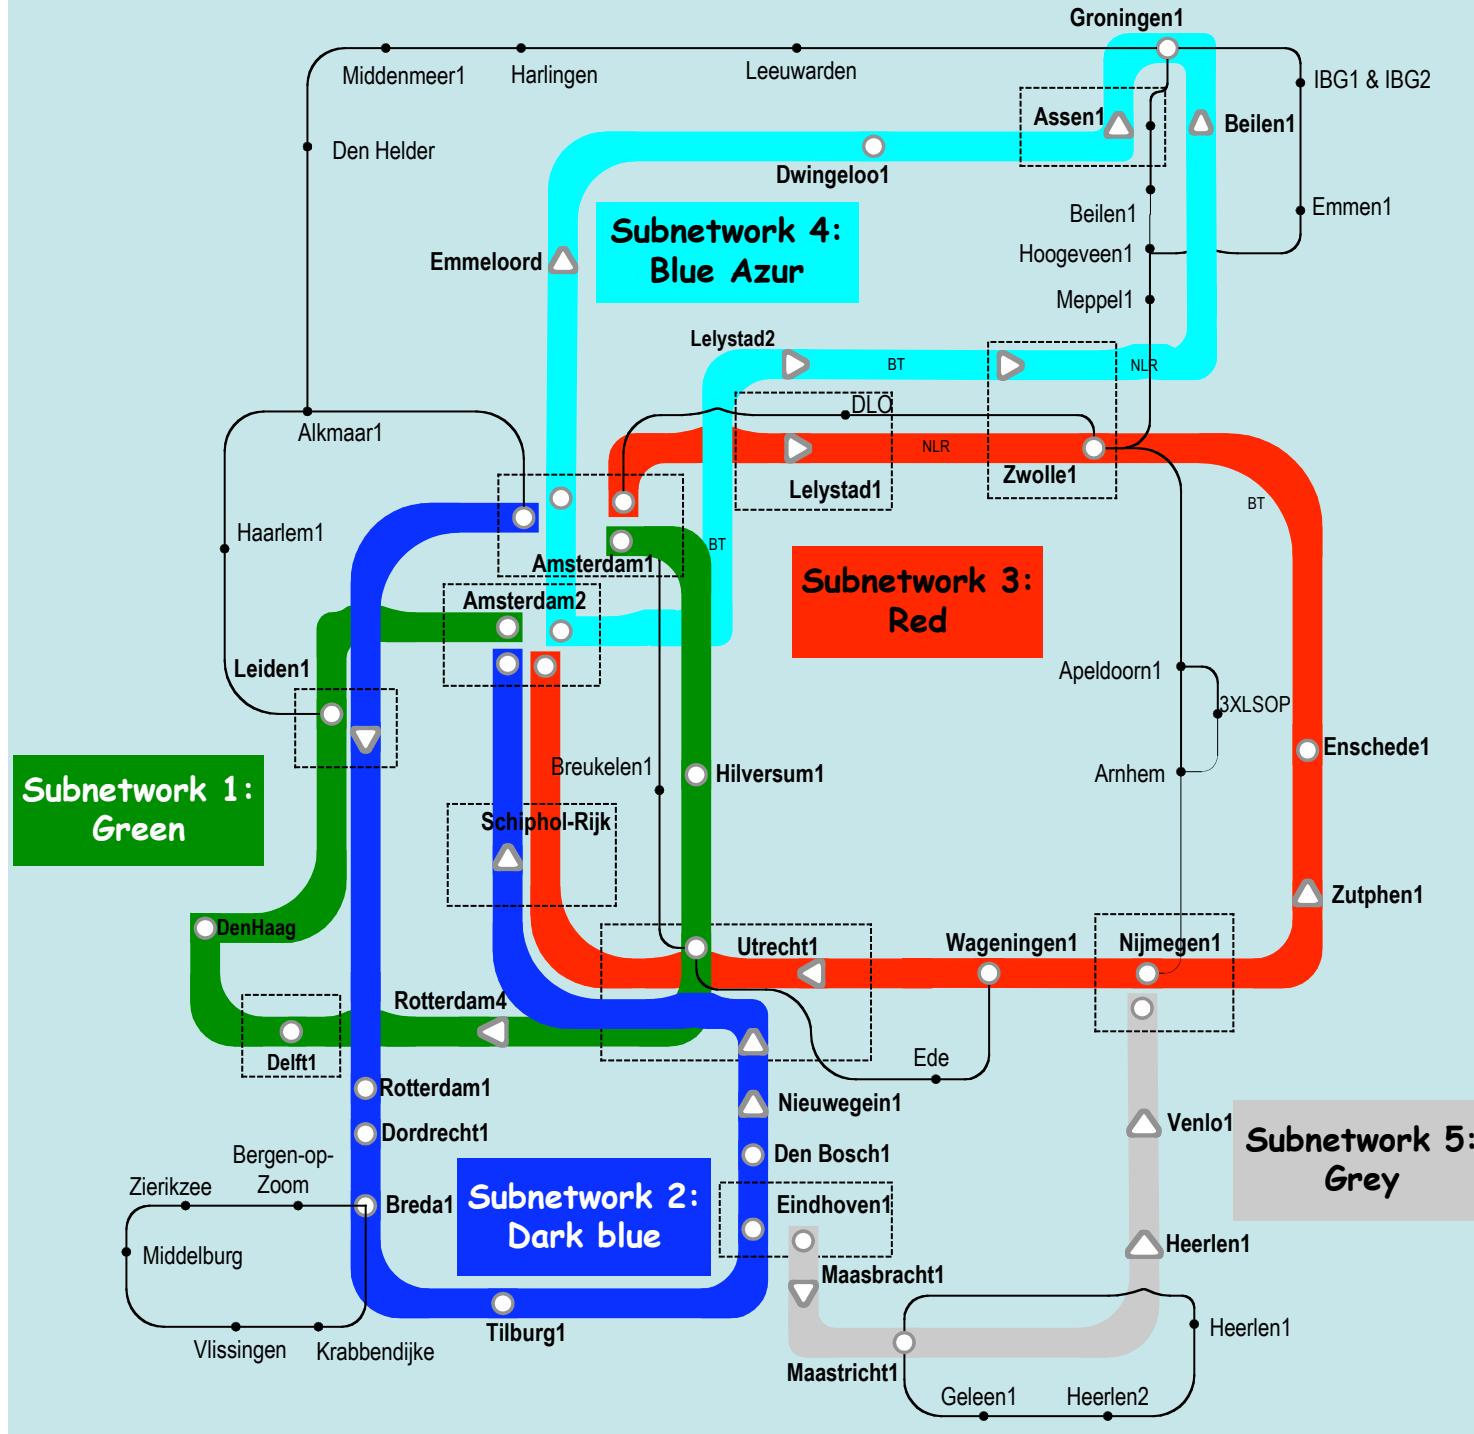

with a user base of ~750K users

> 6000 km
comparable
to railway
system

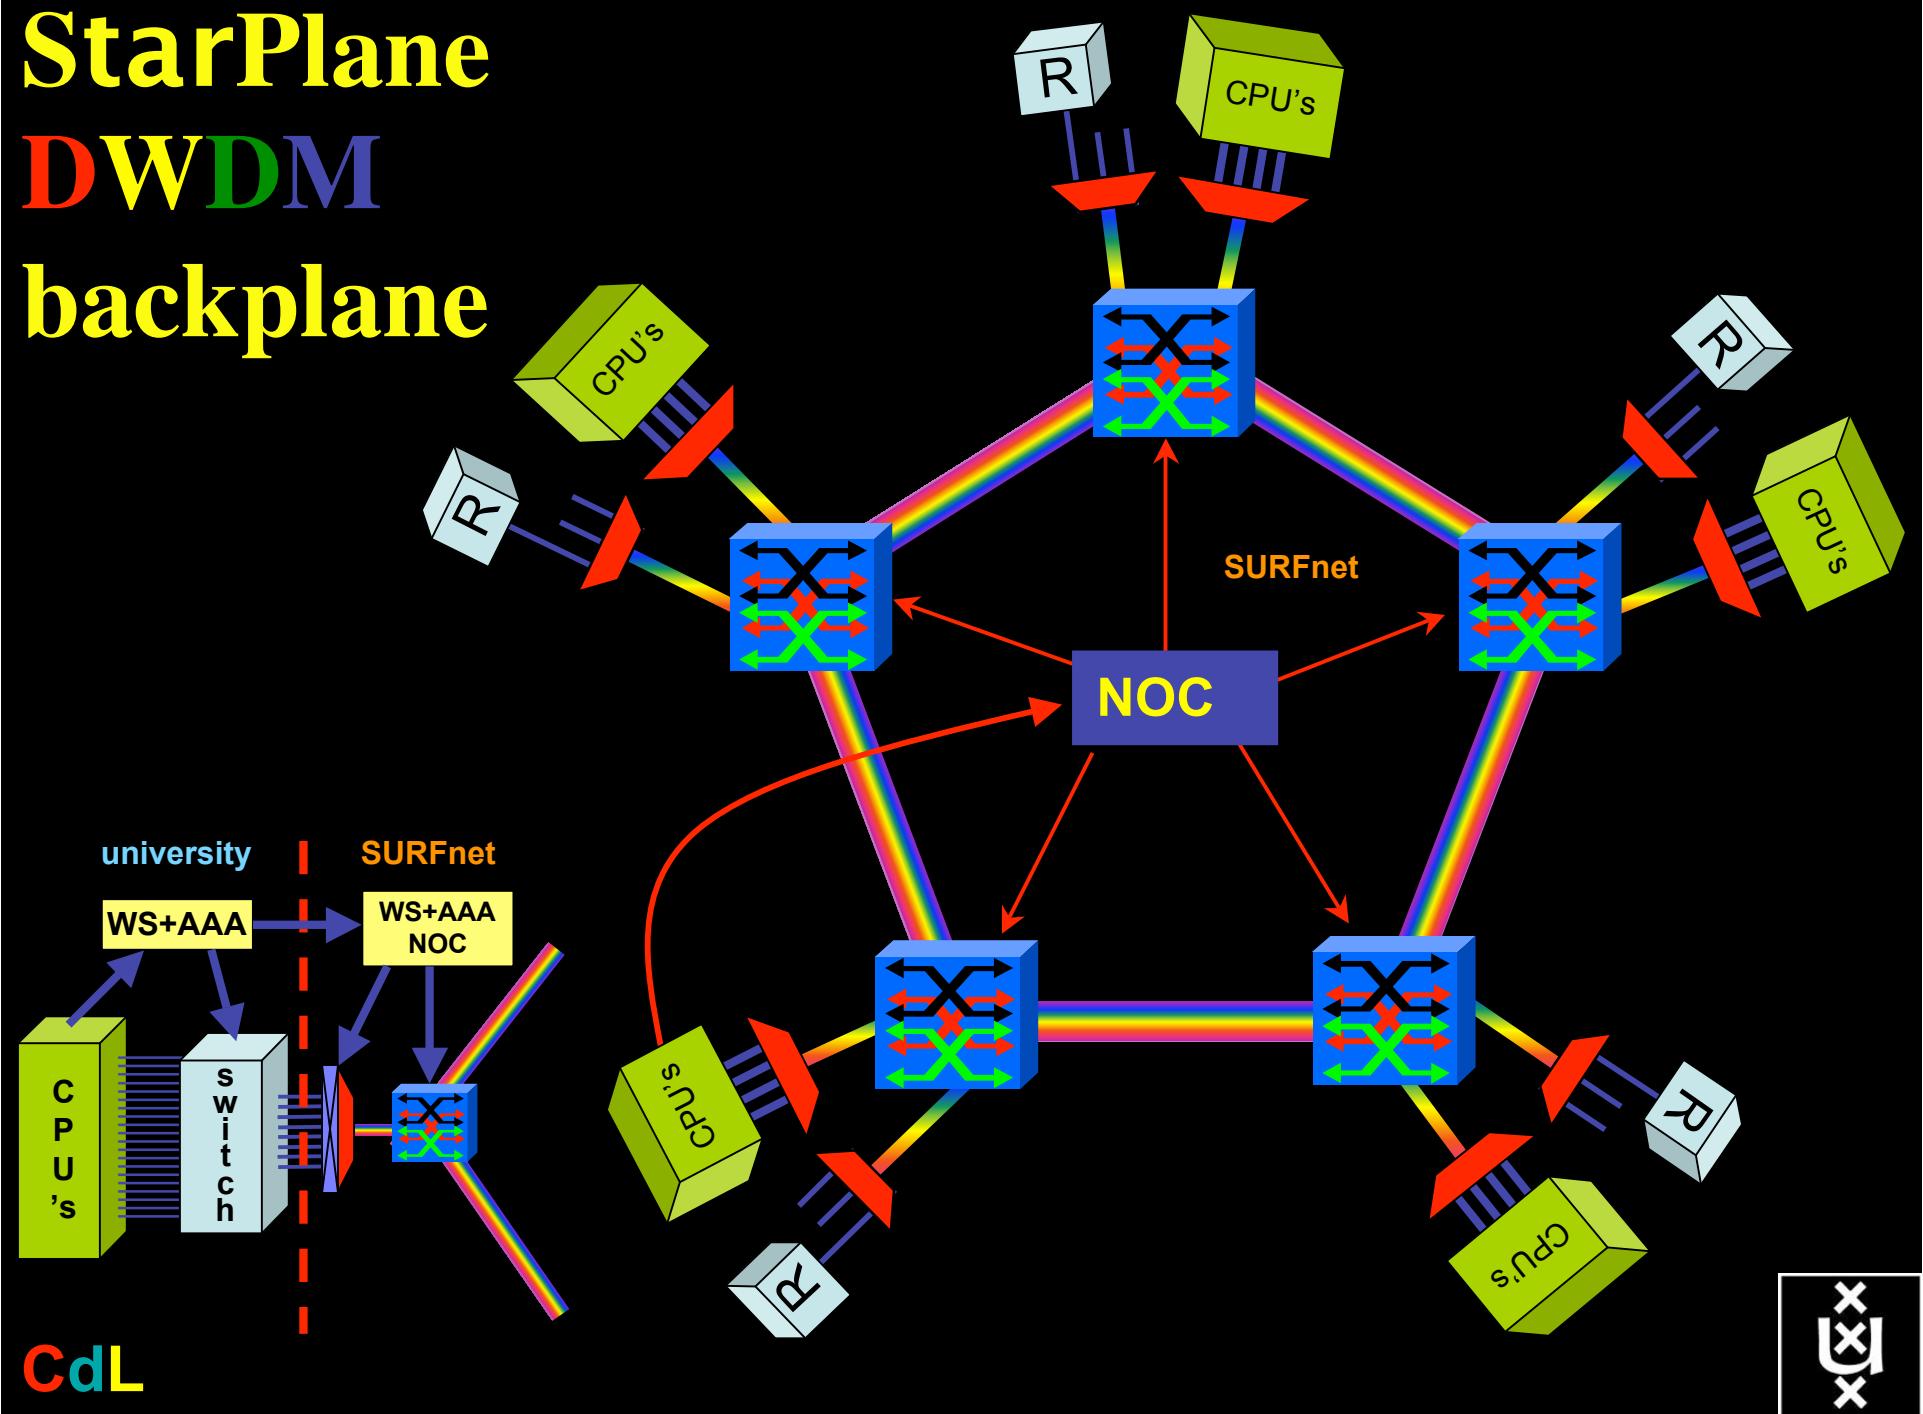

Common Photonic Layer (CPL) in SURFnet6

supports up to
72 Lambda's of
10 G each
40 G soon.

Module Operation

- > this schematic shows
 - several input fibres and one output fibre
 - light is focused and diffracted such that each channel lands on a different MEMS mirror
 - the MEMS mirror is electronically controlled to tilt the reflecting surface
 - the angle of tilt directs the light to the correct port
- > in this example:
 - channel 1 is coming in on port 1 (shown in red)
 - when it hits the MEMS mirror the mirror is tilted to direct this channel from port 1 to the common
 - only port 1 satisfies this angle, therefore all other ports are blocked

What makes StarPlane possible

- Wavelength Selective Switches
- Sandbox by confining StarPlane to a band
- Optimization of the controls to turn on/off a Lambda
- electronic Dynamically Compensating Optics (eDCO)
- traffic engineering

- source routing modified
- Policy interfaces
- AAA interaction (EduRoam, Shibboleth)

StarPlane Overview

StarPlane is a NWO funded project of the University of Amsterdam (UvA) and the Vrije Universiteit (VU). The project uses the photonic network of the Dutch National Research and Education Network - SURFnet - that connects the five compute clusters at the four sites (UvA, VU, TU Delft and Universiteit Leiden). The vision is to allow part of the photonic network infrastructure of SURFnet to be manipulated by Grid applications to optimize the performance of specific scientific applications.

Network Topology

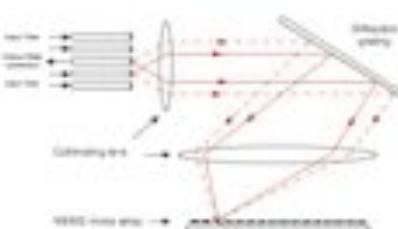

StarPlane is built on top of the photonic SURFnet SURFnet's sixth generation network, built with Nortel and Avici equipment. StarPlane utilizes a full A-band within CPM, i.e., starting with four and later eight 10Gbps wavelengths at each site. Two sets of Wavelength Selective Switches (WSS) placed in 3-degree branch setups allow for seamless 'optical switching/routing' of signals between all five DAS-3 clusters. DWDM filter equipment at all four sites breaks out A-band FB using an OM16500-BB for signal conversion before entering the DAS-1StarPlane WAN equipment. The proposed control plane for the optical/photonic side is a combination of Dynamic Resource Allocation Control (DRAC), GMPLS and Generic AAA.

DAS-3 / StarPlane Site Design

Four of the five DAS-3 clusters use Myrinet's Myri-10G interfaces, switches and 8-port 10GE LAN PHY bridging switch cards for their WAN interconnect. The DAS-3 cluster in Delft will use a stack of Nortel S530x to bundle 2Gbps links per node into eight 10GE LAN PHY interfaces for its WAN interconnect. All eight 10GE LAN PHY connections from each cluster will be connected to a SURFnet Nortel OM16500-BB. The DAS-3 clusters are AMD Opteron based, per site differences in memory, CPU speed, single or dual core, main-storage and LAN interconnect are to satisfy local computational area of expertise and research needs.

Wavelength Selectable Switch

A Wavelength Selectable Switch (SURFnet uses a Nortel WSS) can select wavelengths and send each different wavelength to a specific output port. The StarPlane project novelly utilizes these switches to realize the redirection of certain wavelengths and establish point-to-point lightpaths between nodes at short time-scales. By manipulating the WSS and other optical devices, StarPlane is also able to change the logical topology of the network in real time (subsecond) and allocate the network resources on demand to multiple applications at different clusters.

Key issue #1:
how to describe such networks?

UvA/SARA LightHouse

A joint network research lab of the University of Amsterdam and SARA.
Connects end resources to NetherLight.
Proof of concept e.g. tier 0/1, webservices, GSP

Semantic web

“a universal medium for the exchange of data where data can be shared and processed by automated tools as well as by people”

The Resource Description Framework (RDF) uses XML as an interchange syntax.

Data is described by triplets:

NDL - Network Description Language

A way to describe network resources using RDF.

Parser can use the data to:

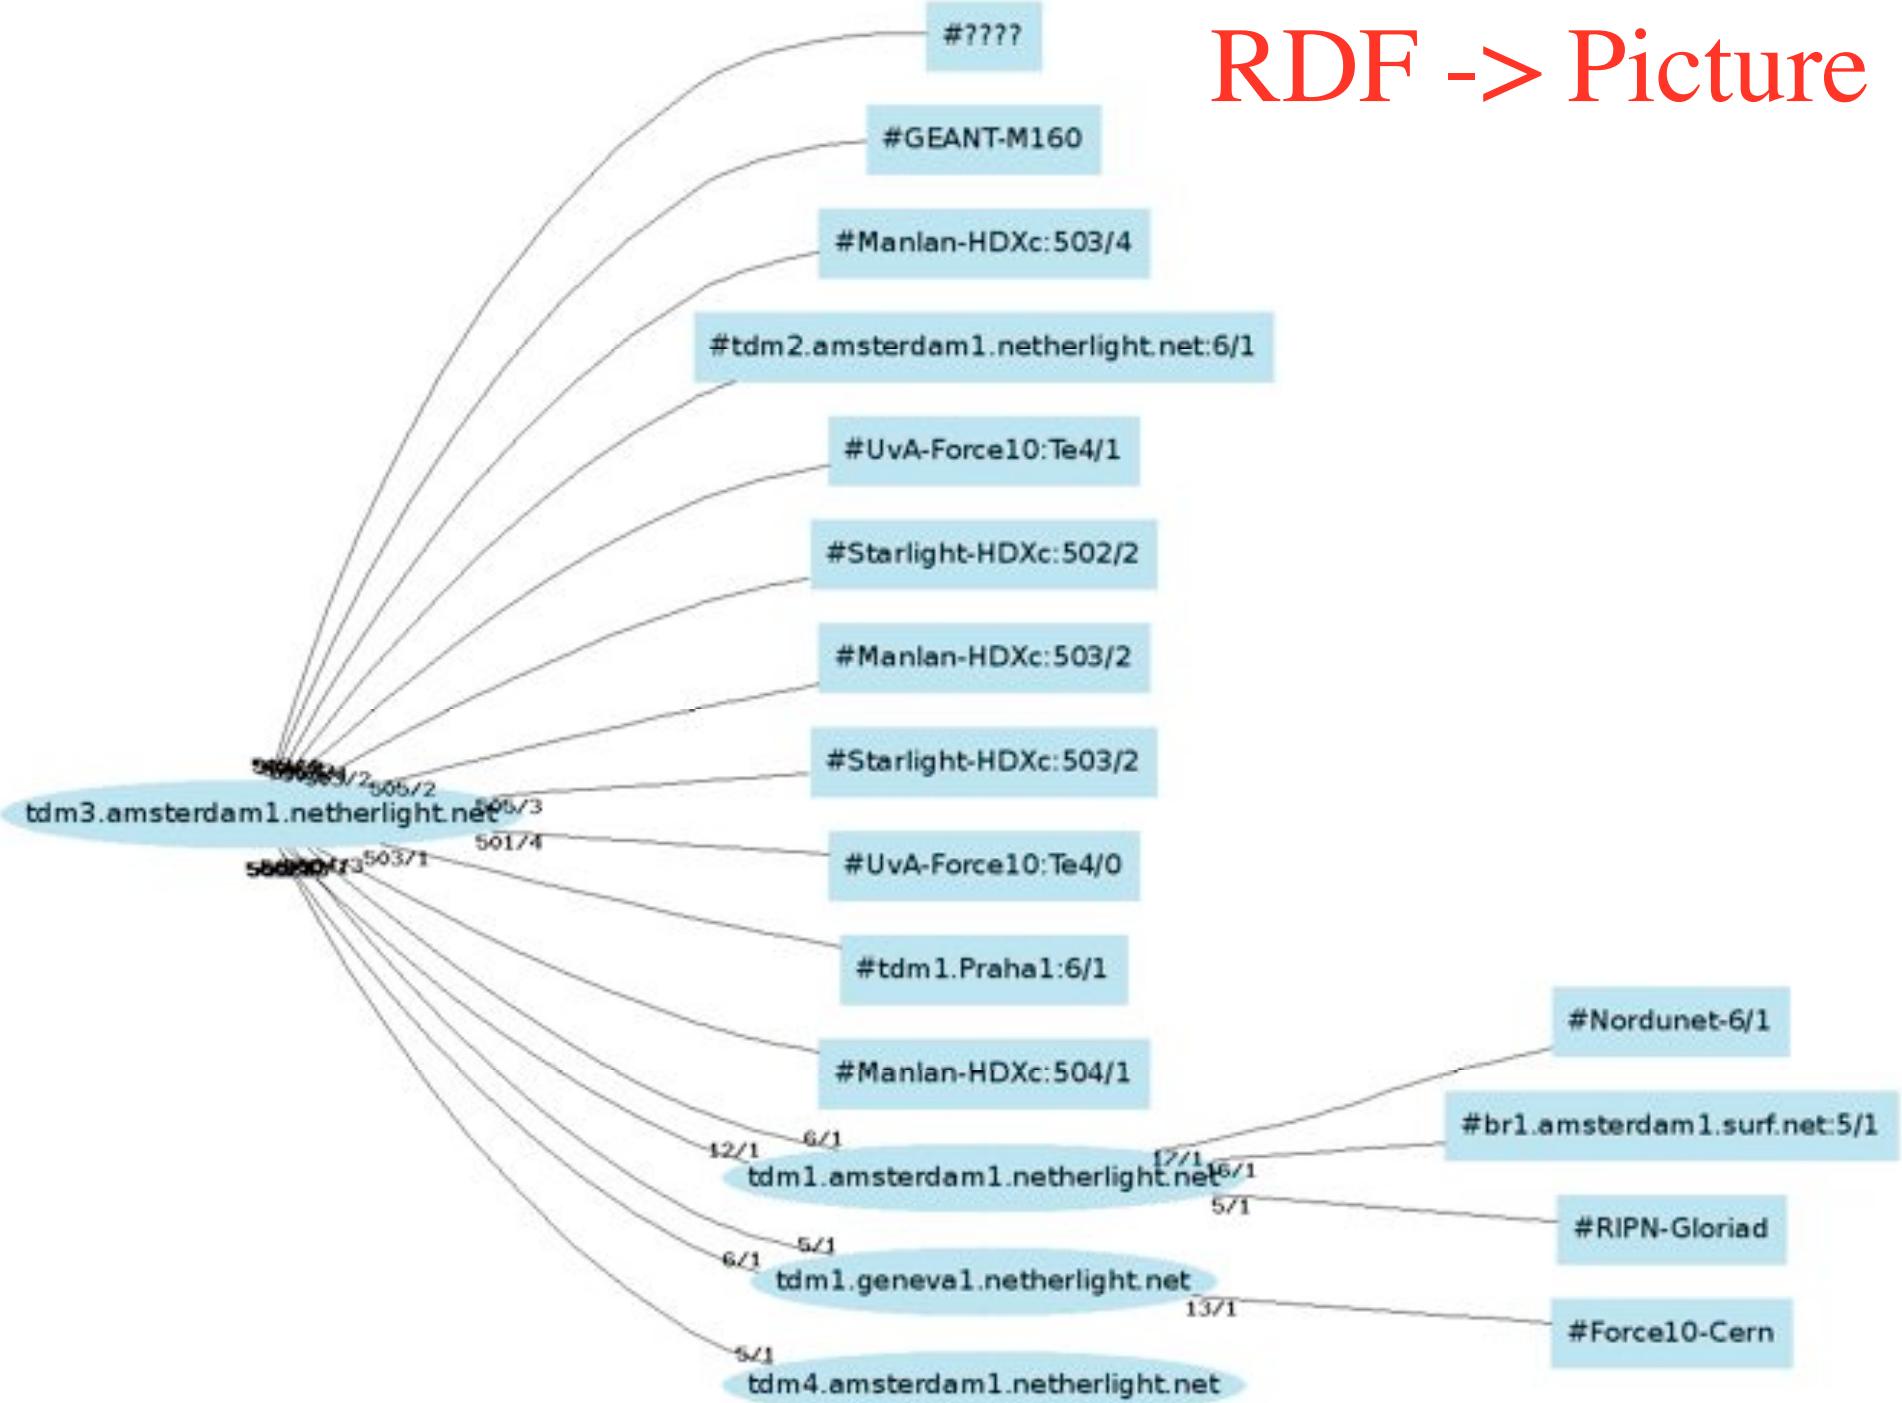

- generate network maps
- provide information to schedulers

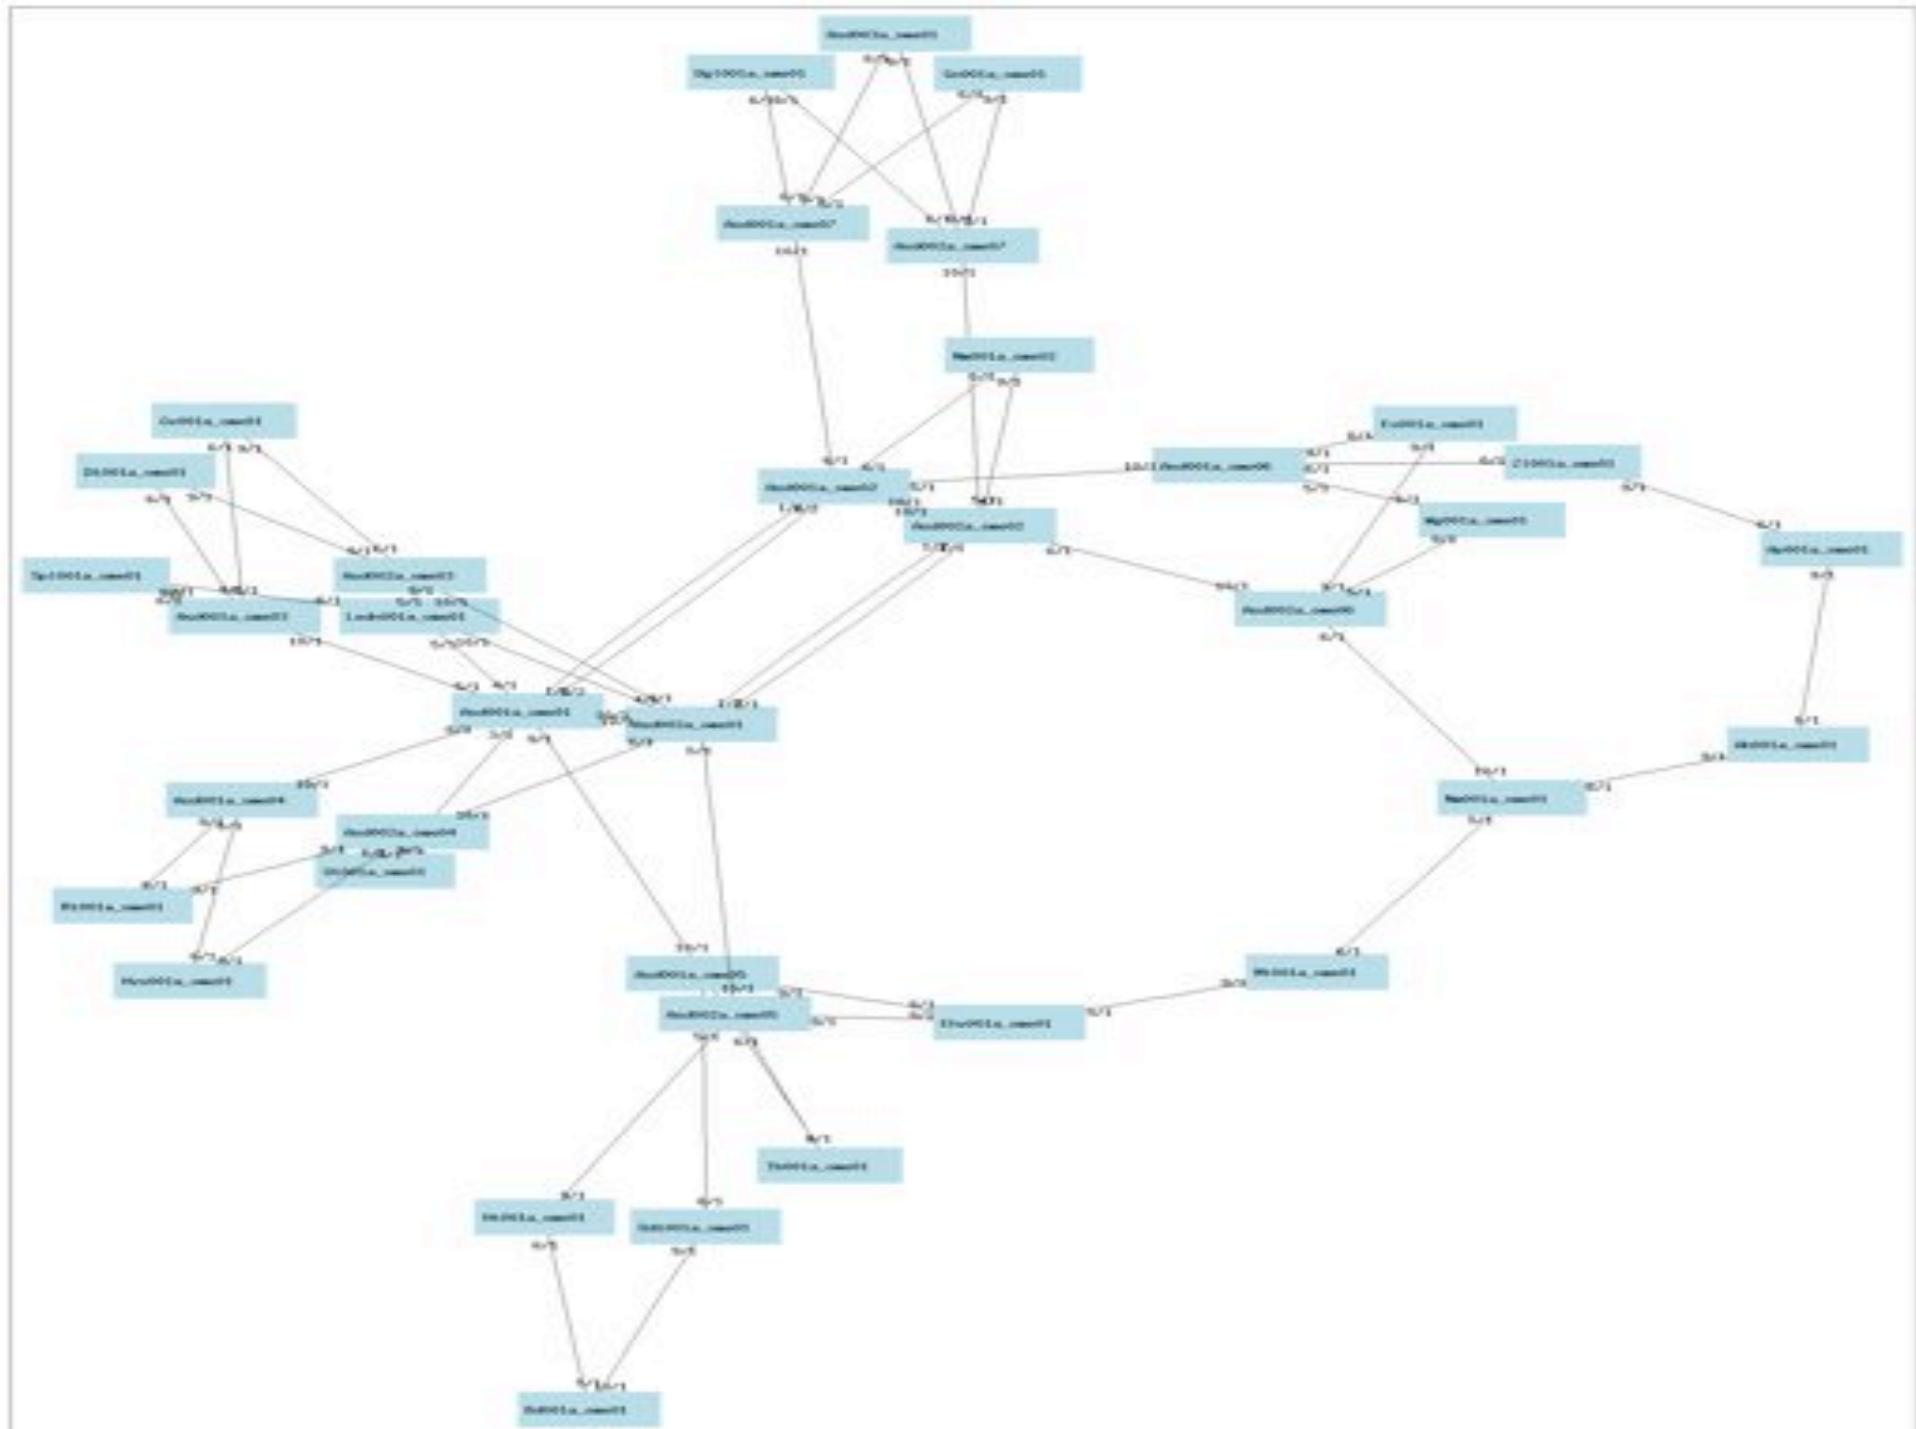

```
<ndl:Device rdf:about="#Vangogh3">
  <ndl:name>Vangogh3</ndl:name>
  <rb:isOfType>ComputingElement</rb:isOfType>
  <ndl:locatedAt rdf:resource="#Lighthouse"/>
  <ndl:hasInterface rdf:resource="#Vangogh3:eth2"/>
</ndl:Device>
```

NetherLight in RDF

```
<?xml version="1.0" encoding="UTF-8"?>

        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:502/5"/>
        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:502/7"/>
        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:502/9"/>
        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:503/3"/>
        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:503/5"/>
        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:503/7"/>
        <ndl:hasInterface rdf:resource="#tdm3.amsterdam1.netherlight.net:503/9"/>
        <!-- all the interfaces of TDM3.amsterdam1.netherlight.net -->
        <ndl:Interface rdf:about="#tdm3.amsterdam1.netherlight.net:501/1">
            <ndl:name>tdm3.amsterdam1.netherlight.net:POS501/1</ndl:name>
            <ndl:connectedTo rdf:resource="#tdm4.amsterdam1.netherlight.net:5/1"/>
        </ndl:Interface>
        <ndl:Interface rdf:about="#tdm3.amsterdam1.netherlight.net:501/2">
            <ndl:name>tdm3.amsterdam1.netherlight.net:POS501/2</ndl:name>
            <ndl:connectedTo rdf:resource="#tdm1.amsterdam1.netherlight.net:12/1"/>
        </ndl:Interface>
    </ndl:Device>
</rdf:RDF>
```

RDF -> Picture

Network Description Language

Semantic for Hybrid Networks

What is NDL?

The Network Description Language (NDL) is a language that can be used to describe hybrid networks, so that different administrative domains can share and correlate topology information.

NDL Basics

NDL is based on Resource Description framework (RDF), a semantic web technique developed by the W3C. RDF describes relations using triplets:

The subject has a property with a value. For example, TDW1 has an interface T2/1.

The most powerful feature of NDL is its ability to effectively create a distributed network topology database.

Correlations between domains are built by referencing from one repository to another; much like a URI can point to another web page.

Recent Developments

The current version of NDL can describe the physical topology of a network. We are extending NDL with features to include higher level knowledge, like device capabilities. This work will be based upon existing standards like ITU-T Recommendation G.803 and GMPLS routing protocols.

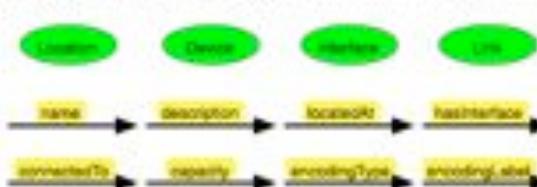

CLIF

Our first proving ground is CLIF, the Global Lambda Integrated Facility, a virtual organisation promoting cooperation in the field of Lambda Networking. Automatic provisioning is an important aspect of the CLIF, and several supporting tools are being developed. However, these tools lack a common network description, which NDL can provide.

Hybrid Networks

Several research networks around the world are implementing hybrid networks. These networks provide end-users with traditional routed IP services, but also lightpaths. To automate lightpath provisioning, broker systems must have topology information, both intra and inter-domain. This requires that the information is described in a computer-readable format.

NDL schema

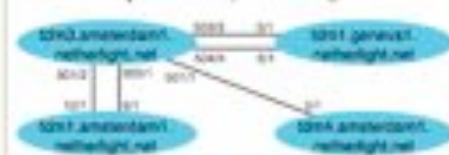

Usage of NDL

- **Network advertisement.** NDL helps the end-user to express a lightpath reservation request, and helps the service provider to validate the feasibility of such a request.
- **Visualization.** Because the topology information can be correlated across domains, NDL allows for automatic generation of network maps that can be shared among providers.
- **Lightpath reservation planning.** A resource broker can use the information to handle a reservation request.
SARA currently uses NDL in SURFnet and Netherlight for both generating topology pictures and lightpath planning.

Code example

```
<nd>:device <rd>:resource <nln>:announced <nln>:lightpath
<nd>:name <rd>:resource <nln>:announced <nln>:lightpath
<nd>:location <rd>:resource <nln>:announced <nln>:lightpath
<nd>:hasInterface <rd>:Resource <nln>:announced <nln>:lightpath
<nd>:hasInterface <rd>:Resource <nln>:announced <nln>:lightpath
<nd>:device <rd>:resource <nln>:announced <nln>:lightpath
<nd>:name <rd>:resource <nln>:announced <nln>:lightpath
<nd>:capacity <rd>:resource <nln>:announced <nln>:lightpath
<nd>:encodingUnit <rd>:resource <nln>:announced <nln>:lightpath
```

Network map

Visit poster session

Key issue #2:
How to book resources on such
networks?

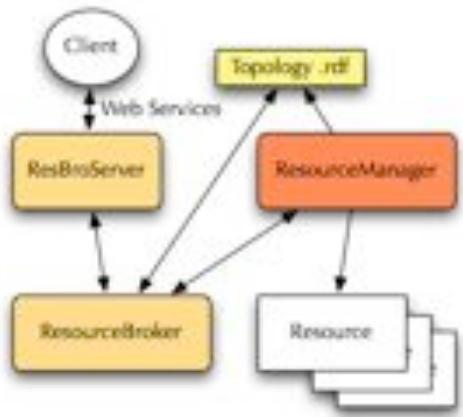

Web services

Web services interfaces provide the API for the reservation framework:

```
<wsdl:operation name="getResourceInformation">
<wsdl:operation name="getResourceList">
<wsdl:operation name="getTypeList">
<wsdl:operation name="getResourcesOfType">
<wsdl:operation name="reservePath">
<wsdl:operation name="getPossiblePaths">
<wsdl:operation name="isPathAvailable">
<wsdl:operation name="confirmPathReservation">
<wsdl:operation name="cancelPathReservation">
```

Resource Brokering: Your Ticket Into NetherLight

Application architecture:

Lambda networking allows the creation of application specific light paths.

Lambda networking facilities empower users to request services and provision end-to-end light paths if and when they need it.

NetherLight, located in Amsterdam, The Netherlands, is one of such facilities.

The Amsterdam LightHouse is a joint research laboratory of the UvA and SARA.

Resources in the LightHouse can be used by collaborators to prove the concepts of hybrid networks.
